Instructions

^ COLLAPSE ^

Overview video: <https://youtu.be/lp568G93Noo>

Guide:

1. Make sure you're in the dev branch locally and `git pull origin dev` any pending changes.
2. Make a new branch per the recommended branch name below (`git checkout -b ...`).
3. Grab the template code from <https://gist.github.com/MattToegel/f7b0489fb0d8cee615d6626056ac5de2>
4. Create individual PHP files for each problem and save the files inside your `public_html` folder in a subfolder of your choice.
5. Move the unedited template files to GitHub.
 1. `git add .`
 2. `git commit -m "adding template files"`
 3. `git push origin branch_name` (see below)
 4. Create and open a pull request from the homework branch to main (leave it open until later steps).
6. Note: As you work, it's recommended to add/commit at least after each solution is done (i.e., 3+ times in this case).
 1. Make sure the files are saved before doing this.
7. Fill in the items in the worksheet below (save as often as necessary).
8. Once finished, export the worksheet.
9. Add the output file to any location of your choice in your repository folder (i.e., a `Module5` folder).
10. Check that git sees it via `git status`.
11. If everything is good, continue to submit.
 1. Track the file(s) via `git add`.

2. Commit the changes via `git commit` (don't forget the commit message).
 3. Push the changes to GitHub via `git push` (don't forget to refer to the proper branch).
 4. Create a pull request from the homework related branch to main (i.e., dev <- "homework branch").
 5. Open and complete the merge of the pull request (it should turn purple).
 6. Locally checkout dev and pull the latest changes (to prepare for future work).
12. Take the same output file and upload it to Canvas.

Branch name: M5-MD-PHP-Problems

Group

Group: Problem 1
Tasks: 1
Points: 3

code showcasing the iteration and selection of variables

Caption(s) (required) ✓

Caption Hint: *Describe/highlight what's being shown*

Task Response Prompt

Explain in concise steps how this logically works

Response:

Firstly, the code checks each bird variable (and it's properties) and sees if for each bird, if it has a set name, color and region since those are the only properties we care about. After that, it gets those properties and puts them into a new array 'subset' that is defined above.

does the math for the years/age related functions and assigns them to variables, adds the old variables to the array as well

Caption(s) (required) ✓

Caption Hint: *Describe/highlight what's being shown*

≡ Task Response Prompt

Explain in concise steps how this logically works

Response:

First, we update the current year to 2024, as it is not defined at the start of the problem. After that, we make a foreach loop that iterates one at a time through each array of cars and their properties. It will check for the already existing properties such as the make, model and year and then below that, it defines two new ones. It does the math for the car age by taking currentYear and subtracting it from the car(year) property in each array. It then checks if that carAge is greater than or equal to 25 to determine if the car is classic or not. From there, it finally adds all of the information into the new processedCars array.

Task Response Prompt

Response:

Using different kinds of loops and arrays in depth was very interesting. The problem that stood out to me the most was Problem 3 as it had us use an associative array in a very helpful and interesting way. It will help us when writing code with lots of different arrays that we will have to do functions on and perhaps have to add based on certain properties or add on to them. The array functions such as associative arrays and other special array types are challenging but rewarding tools to use in these kinds of situations.

End of Task 1

Task

Group: Reflection

Task #2: Include the pull request link for this branch

Weight: ~33%

Points: ~0.33

^ COLLAPSE ^

i Details:

The correct link will end with /pull/ and a number.

Task URLs

URL #1
