Overview video: <https://youtu.be/FPn8KnnJlw8>

For your semester project, you'll be building an application of your choice with the requirement of getting and using data from an API.

This little homework assignment is to get you thinking about your choice before we finish Milestone 1.

Milestone 2 and beyond will be generic requirements that all project options must follow but with their own respective API data and goals.

Even if the Milestones don't 100% match your vision, ensure you still attempt to follow them as closely as possible, even if your vision has other required features not asked for.

1. Create a new branch for this assignment's output file
2. You may need/want to make a placeholder file to add/commit/push so you can open your pull request early
3. Visit <https://rapidapi.com/collections> and find a valid API for your project
4. Things to look for
 2. API is active/works
 3. API is free
 4. Note the quota and whether limits are hard or soft
 5. API has relevant data you can fetch/pull
 6. Exclusions (not an exhaustive list): GPT/LLVM model/AI, memes, weather, data with minimal properties
 7. Safer Examples: cars, food, restaurants/businesses, real estate, products, sports, etc

6. Ensure the choice is college-friendly and legal
5. Review the documentation of your chosen API and understand what data it offers, it's your responsibility to ensure it has what you need for your project vision as this choice won't easily be changed later
6. You don't need to use the data at face value, you can do something fun/interesting with it like I will for my project (i.e., using the data for game mechanics)
7. Milestone Overviews
 8. Milestone 2 will typically have the standard CRUD operations for the data provided by the API
 9. Milestone 3 will typically require the data to be associated with a user in some form or another, keep this in mind when thinking about your project scope
 10. **Note:** You'll only be fetching data from the API, the goal is to work with your application data only which will be a mix of API entities and user-generated entities of the same type
8. Fill in the below deliverables
9. Grab the exported PDF at the end and add it to your local repository
10. Add/commit/push the completed file to this branch
11. Merge the pull request to dev
12. Create and Merge a pull request from dev to prod
13. Upload the output PDF to Canvas
14. Locally checkout dev
15. Pull the latest changes so you're up to date for a future branch

Task

Group: API

Task #2: Explain what data you'll be using from the API and how you plan to use it in the project

Weight: ~33%

Points: ~2.67

^ COLLAPSE ^

Columns: 1

Sub-Task

Group: API

Task #2: Explain what data you'll be using from the API and how you plan to use it in the project

Sub Task #1: Mention what data and properties of the data you plan to use from the API (likely won't be all in some cases)

Task Response Prompt

Response

Response:

This API is for use on a video game database type of website where you can get information about the games the API has in its catalog such as the name, cover art, genre, series, publisher, etc. I won't use all of the requests but I will use the basics to start (title, coverart, publisher, series, ESRB) and then maybe a few extra ones such as its rating/popularity and what platforms the game is on. There is much more extra data such as the global rating of a game (on the API's main website), characters involved in the game and more but having too much data on the page/involved with each request would be a lot to handle at once. However, the API is free in line with the requirements and has a reasonable amount of request rates per month so I am not too worried about it being an issue.

Sub-Task

Group: API

Task #2: Explain what data you'll be using from the API and how you plan to use it in the project

Sub Task #2: How do you plan to utilize the data for the scope of your project? What's your goal/vision?

Task Response Prompt

Response

Response:

I think I will use the data from the API to make my own video game database website but add a personal twist. I will

let users make accounts so they can make their own lists of games they own which will then point them to the information already on the website/API. This would ensure that each user would need a database or some sort of variable to see their saved/owned games and things like that but it also involves a more personal level of interaction compared to just looking at the games. Overall, the goal is for the site to display the relevant information on a game properly and give users the ability to create an account so they can make a digital collection/list of games they own.

Sub-Task

Group: API

100%

Task #2: Explain what data you'll be using from the API and how you plan to use it in the project
Sub Task #3: Mention all the API routes/endpoints you intend to use and what criteria will be required for them if any (beyond the API key)

Task Response Prompt

Response

Response:

All of the endpoints for this API are hosted on [https://api.igdb.com/v4/\(query\)](https://api.igdb.com/v4/(query)). The only thing required for use after you register with a Twitch account (which I have) is the API key which you get access to once you register through the Twitch Developer Portal.

Task #3: API Info

Sub Task #1: Provide details about the quota (quantity, hard/soft, refresh time, extra costs, etc)

Task Response Prompt

Response

Response:

This API is free and it has a Rate Limit of 1000 requests per hour which should be more than enough for the project. However, the documentation states that there is a rate limit of 4 requests per second and that you can have up to 8 open requests at a time. This seems like a slight limitation but it can be avoided by segmenting/delaying groups of requests so that the limit is not reached.

Sub-Task

Group: API

100%

Task #3: API Info

Sub Task #2: What limitations do you need to keep in mind when interacting with the API?

Task Response Prompt

Response

Response:

As just mentioned, the biggest potential limit is the four requests per second which could cause some complications when it comes to viewing many pieces of information on a game. However, this can be avoided/mitigated by delaying the execution of certain requests until it is verified that others are completed. I'm sure it is possible but it will just take some extra time/work to sort it out. Other than that, the general 1000 requests per hour is very generous for what I will be using this for.

Sub-Task

Group: Misc

Task #2: General Prompts (see checklist, copy/paste the prompts into the submission)

Sub Task #1: Have you ever worked on consuming an API? If so, briefly explain.

≡ Task Response Prompt

Response

Response:

I have never used an API like this for a project before. This would be my first project using an API in general (let alone one from someone else).

Sub-Task

Group: Misc

Task #2: General Prompts (see checklist, copy/paste the prompts into the submission)

Sub Task #2: Have you ever created an API that was consumed by your own application or consumed by other people?

≡ Task Response Prompt

Response

Response:

I have never created an API for myself or someone else before.

Sub-Task

Group: Misc

Task #2: General Prompts (see checklist, copy/paste the prompts into the submission)

Sub Task #3: Do you have any other alternative API choices in mind in case this doesn't work out? List them if you do. (Note: it's a good idea to have a backup)

≡ Task Response Prompt

Response

Response:

Since this API meets the requirements based on a reasonable ammount of reqursts and it being free, I haven't really considered an alternative. If it does come up, I'm sure I will find something but I also put in a request for this API on the Google Sheets document first so I think I would get priority if there is a duplicate idea.
