## Instructions

^ COLLAPSE ^

Overview Video: <https://youtu.be/-4hlb9MXrQE>

1. Implement the Milestone 3 features from the project's proposal document:  
<https://docs.google.com/document/d/1XE96a8DQ52Vp49XACBDTNCq0xYDt3kF29cO88EWVwfo/view>
2. Make sure you add your ucid/date as code comments where code changes are done
3. All code changes should reach the Milestone3 branch
4. Create a pull request from Milestone3 to dev and keep it open until you get the output PDF from this assignment.
5. Gather the evidence of feature completion based on the below tasks.
6. Once finished, get the output PDF and copy/move it to your repository folder on your local machine.
7. Run the necessary git add, commit, and push steps to move it to GitHub
8. Complete the pull request that was opened earlier
9. Create and merge a pull request from dev to prod
10. Upload the same output PDF to Canvas

Branch name: Milestone3

## ≡ Task Response Prompt

Response:

The users will have a watchlist/favorites list that they will manually update themselves. At the end of each game listed, there will be a heart, if they click the heart, the game will be added to their watchlist. It is a one to many relationship.

End of Task 1

Task

Group: API  
Task #2: Updating Entities  
Weight: ~50%  
Points: ~0.50

^ COLLAPSE ^

Checklist

\*The checkboxes are for your own tracking

| #                           | Details                                                                                   |
|-----------------------------|-------------------------------------------------------------------------------------------|
| <input type="checkbox"/> #1 | When an update occurs either manually or from the API how does it affect associated data? |
| <input type="checkbox"/> #2 | Do users see the old data, new data, does data need to be reassociated, etc?              |

## ≡ Task Response Prompt

Response:

If an update occurs manually from an admin, the data will be changed (as there are parameters to edit it as an admin). In terms of the data being updated by the API, a user will have to call in the data again from the API to get it to update to whatever it's latest form may be. Until an update is made either way, the data will be the same as it is from the time of the API request.

```

Shows all of toggle\_watched which handles when a user clicks the heart to watch/favorite a game and when they unfavorite it

**Caption(s) (required)** ✓

Caption Hint: *Describe/highlight what's being shown*

**Task Response Prompt**

*Explain in concise steps how this logically works and mention which option your application handles regarding association*

Response:

My implementation of this feature is the first one, where the user themselves decides which data they want to associate to themselves by favoriting/watching it. This is accomplished by clicking the heart button next to the game to add the game to the watchlist and clicking it again to remove it. Firstly, the code in table.php and list\_games works together to display the icon and is\_watched in the table. From there, if a user clicks the heart it will be handled in toggle\_watched which gets the user\_id of the user and associates it with the game\_id in the Usergames table (which holds the associations). If a user clicks the heart again, the association in the table is removed/deleted.

Gallery Style: 2 Columns

4 2 1

Caption(s) (required) ✓

Caption Hint: *Describe/highlight what's being shown*

Task Response Prompt

*Describe each column/association table*

Response:

The id in the first row is the association id. From there, the user id and game id are taken from the Users table and the IT202\_F2024\_Games table to map/associate them together. Created and modified are showed so an admin can reference when the association was made between the user and the data and when it was modified.

This code  
from table.php  
applies to all  
tables  
(including this  
one) which  
creates the  
heart button to  
add/delete

Describe/highlight what's being shown

## Task Response Prompt

Explain in concise steps how this logically works and mention how you determine the result list (include the association logic and filters)  
Response:

The query gets games from the database (for the normal game info) and then the user's associations. It filters the query by users, as each user id is used to get proper games that a user has added to their list.

## Task Response Prompt

Explain in concise steps how this logically works

Response:

The table is built in the first screenshot and in the second screenshot the table is rendered with render\_table which gives it the favorite/watch heart button and other specific features (shown later).

Describe/highlight what's being shown

## Task Response Prompt

Explain in concise steps how this logically works

Response:

The view url is passed into the table and is rendered when the page loads. The url is defined in table.php.

add, delete  
watched  
games

Caption(s) (required) ✓

Caption Hint:

Describe/highlight what's being shown

## Task Response Prompt

Explain in concise steps how this logically works

Response:

This gets the results from toggle\_watched, creates the button and sets it up so when someone presses the watch/favorite heart button, is\_watched gets set to 1.

## Task Response Prompt

Explain in concise steps how this logically works

Response:

When someone clicks the button in watchlist, it executes the code in clear\_watchlist which removes the user\_id based association from the gameslist, deleting the user's associations.

## Task Response Prompt

Explain in concise steps how this logically works

Response:

Counts each game based on how many games there are and displays the total (second screenshot). It displays the total based on the results that are shown based on filter compared to the actual total ammount (regardless of filter).

## Task Response Prompt

Explain in concise steps how this logically works

Response:

Shows both results filtered and unfiltered on the page.

## Task Response Prompt

Explain in concise steps how this logically works

Response:

To start, limit is 10 by default. Inside of the if statement, it ensures that if the number is greater than 100 and less than 0, it will be 10, making it so there will never be an input error where nothing shows up.

## Task Response Prompt

Response:

I was not able to complete the Admin Association Management page due to time limitations. Other than that, all of the other pages and their features were completed sufficiently. It is unfortunate that I wasn't able to complete the last page but it's features were too complex for the ammount of time (less than a day) that I had remaining due to working to flesh out other pages and making sure that they worked fully according to the requirements. Other than that, I didn't have any major issues throughout the extent of working on this Milestone.
